### HOW TO REPLY TO THIS NOTICE:

#### I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

### **REASONS FOR ALLOWANCE**

The appeal brief filed 2/8/10 has been considered. Claims 2-9, 11, 14-38 are pending.

1. The following is an examiner's statement of reasons for allowance:

Concerning claims 2-9, 11, and 14-38, no prior art has been found teaching or suggesting a method for real time monitoring a target nucleic acid amplification during the amplification comprising using a first oligonucleotide probe and a second oligonucleotide probe in which the first probe i) is capable of hybridizing to the target nucleic acid; ii) comprises a fluorophore; and iii) is not equal in length to the second probe; and the second probe i) is capable of hybridizing to the first probe; and ii) has a quencher molecule which quenches the first probe fluorophore when the first and second probes are hybridized to each other; and detecting fluorescence of the first probe fluorophore in real-time to monitor amplification, wherein an increase in fluorescence correlates with amplification.

The closest prior art is the reference of Heid et al. and Heller et al. Heid et al. disclose a real time quantitative PCR amplification in which PCR product accumulation is measured through a dual-labeled fluorogenic probe with a reporter dye (FAM) and a quencher dye (TAMRA). When the dual-labeled fluorogenic probe is intact, there are no detectable signal results and during polymerase extension the single dual labeled fluorogenic probe is cleaved by an enzyme's 5' to 3' nucleolytic activity and the dyes are permanently separated. The detectable fluorescence is proportional to the amount of digested probe and the amount of amplified target nucleic acid. Heid et al. did not suggest that this single probe detection may be modified to multi-probe system. Heller et al. disclose a nucleic acid detection system having multi-probe in which a first probe contains a fluorophore and is capable of hybridizing to a target nucleic acid, a

Art Unit: 1637

second probe contains a quencher and is capable of hybridizing to the first probe and quenching to the fluorescence of the fluorophore upon hybridization and a third probe containing multiple donor fluorophores capable of FRET with the fluorophore bound to the first probe is capable of hybridizing to the target nucleic acid. The method of Heid et al. relies on a 5'- to 3'-exonuclease activity associated with a DNA polymerase used in nucleic acid amplification. If the entire Heller's three-probe system was applied to the method of Heid et al. the first probe and the third probe upon hybridization to the target nucleic acid would be digested by the exonuclease. No detectable signal would be produced. Thus, because of technical incompatibilities, one of ordinary skill in the art would not combine the teachings of Heller et al. and Heid et al. to carry out the method as claimed. The instant claims are patentable over the teachings of Heid et al. and Heller et al.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
